Response to Office Action dated July 7, 2006

Amendments to the Claims

This listing of claims replaces all prior versions, and listings, of claims in the application:

Listing of Claims

1. (Currently Amended) A system for controlling an axial movement of an article, the system

comprising:

- a support stage assembly; and

- a spring suspension arrangement mounted on said support stage assembly and

comprising first and second assemblies arranged in a coaxial relationship with respect to

the axis of the article movement, and one inside the other, the first assembly being

attached to said support stage assembly and the second assembly serving for supporting

an article-carrying member and being driven for movement along said axis of the article

movement with respect to the first assembly, the outer one of the first and second

assemblies being configured to define two spaced-apart parallel planes perpendicular to

said axis of the article movement, said first and second assemblies being attached to each

other by first and second membrane[[-like]] members arranged in a spaced-apart parallel

relationship along said axis of the article movement.

2. (Original) The system of claim 1, comprising a drive assembly associated with said first

assembly and operable to provide said movement thereof along said axis.

Response to Office Action dated July 7, 2006

3. (Original) The system of claim 1, wherein said outer assembly is attached to the support stage

assembly, and said inner assembly is driven for movement along said axis.

4. (Cancelled)

5. (Currently Amended) The system of claim 1, wherein said outer assembly is composed of at

least three spaced-apart pin[[-like]] members kept at a fixed position with respect to one another,

and said inner assembly is composed of at least one pin[[-like]] member.

6. (Currently Amended) The system of claim 5, wherein an arrangement of said at least three

fixed members of the outer assembly defines a regular polygon, and the pin[[-like]] member of

the inner assembly is located substantially at the center of said polygon.

7. (Currently Amended) The system of claim 1, wherein the outer and inner assemblies have

substantially the same height.

8. (Original) The system of claim 1, wherein said outer and inner assemblies are configured as

cylinders or prisms.

Appl. No. 10/647,123

Attorney Docket No. 25667

Response to Office Action dated July 7, 2006

9. (Currently Amended) The system of claim 8, wherein the inner assembly at its top and bottom

portions is attached to the top and bottom portions of the outer assembly by said first and second

membrane[[-like]] members, respectively.

10. (Currently Amended) The system of claim 9, wherein said membrane[[-like]] members have

substantially annular geometry.

11. (Currently Amended) The system of claim 9, wherein said membrane[[-like]] members are

clamped to the opposite sides of each of the outer and inner assemblies via clamping rings.

12. (Original) The system of claim 8, wherein said inner assembly is driven for said movement

with respect to the outer assembly, said outer assembly being attached to the support stage

assembly.

13. (Original) The system of claim 8, wherein the outer assembly is driven for said movement

with respect to the inner assembly, said inner assembly being attached to the support stage

assembly.

14. (Original) The system of claim 1, comprising the article-carrying member mounted on the

second assembly for rotation with respect to said second assembly, the system being thereby

operable as a Z-Theta-system.

Response to Office Action dated July 7, 2006

15. (Original) The system of claim 1, wherein said support stage assembly is driven for

movement in a plane perpendicular to said axis.

16. (Original) The system of claim 14, wherein said support stage assembly is driven for

movement in a plane perpendicular to the Z-axis, the system being thereby operable as a Z-R-

Theta-system.

17. (Currently Amended) The system of claim 16 for use in transfer and positioning of a disk[[-

like]] article with respect to said axis, wherein the support stage assembly is movable along a

perpendicular axis for a distance of at least a radius of the article.

18. (Original) The system of claim 1, wherein the article-carrying member is mounted on a

central axis of said second assembly by means of a pair of spherical washers facing each other by

their male and female surfaces, respectively, thereby enabling precise positioning of the article-

carrying member in a plane perpendicular to said axis.

19. (Currently Amended) The system of claim 2, wherein said drive assembly comprises a

mechanical pair formed by a roller bearing mounted on a tapered surface of [[the]] a wedge

element; and a motor operable for moving the wedge element along an axis perpendicular to said

axis.

Response to Office Action dated July 7, 2006

20. (Currently Amended) A system for controlling movement of an article along at least a

vertical axis, the system comprising:

- a support stage assembly; and

- a spring suspension arrangement mounted on said support stage assembly and

comprising first and second vertically oriented cylindrical assemblies arranged in a

coaxial relationship one inside the other, the first assembly being attached to said support

stage assembly and the second assembly serving for supporting an article-carrying

member and being driven for movement along the vertical axis with respect to the first

assembly, the inner cylindrical assembly at its top and bottom being attached to the top

and bottom of the outer cylindrical assembly by, respectively, first and second

membrane[[-like]] members thereby arranged in a spaced-apart parallel relationship along

the vertical axis.

21. (Original) The system of claim 20, comprising a drive assembly associated with said second

cylindrical assembly and operable to provide said movement thereof along the vertical axis.

22. (Original) The system of claim 20, wherein said support stage assembly is driven for

movement along at least one horizontal axis.

Appl. No. 10/647,123

Attorney Docket No. 25667

Response to Office Action dated July 7, 2006

23. (Original) The system of claim 20, comprising the article-carrying member mounted on said

second cylindrical assembly and driven for rotation with respect to said first cylindrical assembly.

24. (Currently Amended) A system for controlling movement of an article along at least a

vertical axis, the system comprising:

- a support stage assembly;

- a spring suspension arrangement mounted on said support stage assembly and

comprising first and second vertically oriented cylindrical assemblies arranged in a

coaxial relationship one inside the other, the outer cylindrical assembly being attached to

said support stage assembly and the inner cylindrical assembly serving for supporting an

article-carrying member and being driven for movement along the vertical axis with

respect to the outer assembly, the inner cylindrical assembly at its top and bottom being

attached to the top and bottom of the outer cylindrical assembly by, respectively, first and

second membrane[[-like]] members being thereby arranged in a spaced-apart parallel

relationship along the vertical axis[[,]]; and

- a drive assembly associated with said inner cylindrical assembly and operable to provide

said movement thereof.

25. (Currently Amended) An R-Theta-Z system for controlling movement of an article along the

Z-axis and in a horizontal plane, the system comprising:

- a support stage assembly driven for movement along a horizontal axis; and

Appl. No. 10/647,123 Attorney Docket No. 25667 Response to Office Action dated July 7, 2006

- a spring suspension arrangement mounted on said support stage assembly and comprising first and second vertically oriented cylindrical assemblies arranged in a coaxial relationship one inside the other, the first assembly being attached to said support stage assembly, and the second assembly serving for supporting an article-carrying member and being driven for movement along the vertical axis with respect to the first assembly, said article-carrying member being driven for rotation in the horizontal plane, the inner cylindrical assembly at its top and bottom being attached to the top and bottom of the outer cylindrical assembly by, respectively, first and second membrane[[-like]] members thereby arranged in a spaced-apart parallel relationship along the vertical axis.

26. (Currently Amended) An X-Y-Theta-Z system for controlling movement of an article along the Z-axis and in the horizontal X-Y-plane, the system comprising:

- a support stage assembly driven for movement along X-and Y-axes; and

-a spring suspension arrangement mounted on said support stage assembly and comprising first and second vertically oriented cylindrical assemblies arranged in a coaxial relationship one inside the other, the first assembly being attached to said support stage assembly, and the second assembly serving for supporting an article-carrying member and being driven for movement along the vertical axis with respect to the first assembly, said article-carrying member being driven for rotation in the horizontal plane, the inner cylindrical assembly at its top and bottom being attached to the top and bottom

Appl. No. 10/647,123 Attorney Docket No. 25667 Response to Office Action dated July 7, 2006

of the outer cylindrical assembly by, respectively, first and second membrane[[-like]] members thereby arranged in a spaced-apart parallel relationship along the vertical axis.
